The Wiener polarity index (usually denoted by W) of an alkane is the number of unordered pairs of carbon atoms which are separated by three carbon-carbon bonds. This topological index is useful for predicting the boiling points of alkanes. Deng [MATCH Commun. Math. Comput. Chem. 66 (2011) 305] proved that the maximum value among all alkanes, with n carbon atoms, is $\lfloor \frac{n-1}{2} \rfloor$.
