A research review suggests that a high brain concentration of DHA can optimize synaptic plasticity and efficiency and help maintain homeostasis in the synapses (Denis et al., 2013). For efficient transmission of data between brain cells, the plasma membrane must remain fluid. DHA is a component of this membrane.

Substantial evidence exists showing links between epigenetic events and regulation of metabolic pathways leading to obesity and type 2 diabetes (Chapter 11). The significance of the timing of such events cannot be overlooked, particularly in fetal development, in which exposure to an undersupply or oversupply of energy and some nutrients results in altered chromatin structuring and DNA modification, thereby influencing expression of key genes.
