Immunology for Dummies: Amazon.com

The immune system works hard to defend you from pathogens, including bacteria and viruses. It's made up of leukocytes (white blood cells), proteins, and other tissues, including the lymphatic system. When it's not fighting infection, the lymphatic system is busy draining excess fluid from the body's tissues and removing debris from that fluid.

Clinical Overview of the Immune System - dummies

The immune system is designed to protect the body from pathogens. In humans, the immune system begins to develop in the embryo. The immune system starts with hematopoietic (from Greek, "blood-making") stem cells. These stem cells differentiate into the major players in the immune system (granulocytes, monocytes, and lymphocytes).

Introduction to Immunology Tutorial

There are several cytokines important for Th cell education. They most important ones are IL-4, IL-12, IL-6, TGF β and IL-10. Th cells will differentiate into different types of Th cells depending on which cytokines prevail. The main types of Th cells are T helper 1 (Th1) cells, T helper 2 (Th2) cells,...

Basic Immunology | The IBD Immunologist

The receptor of T cells can only recognize antigen fragments in complex with MHC proteins. Following phagocytosis of a pathogen, fragments of the pathogen are complexed with MHC proteins and displayed on the surface of the macrophage or dendritic cells of the innate immune system.

Immunology • Immunology - the study of how the body fights disease and infection • Immunity - State of being able to resist a particular infection or toxin

Understanding basic immunology

The immune system helps to protect us against diseases caused by tiny invaders (called pathogens) such as viruses, bacteria, and parasites. The immune system is made up of specialized organs, cells, and tissues that all work together to destroy these invaders.

Biology for Kids: Immune System - Ducksters

The immune system is a network of cells, tissues*, and organs that work together to defend the body against attacks by “foreign” invaders. These are primarily microbes (germs)—tiny, infection-causing organisms such as bacteria, viruses, parasites, and fungi. Because the human body provides an ideal environment for many microbes, they try to break in.

Understanding the Immune System: How it works

This immunologic memory allows your immune system to respond much more effectively when you meet a particular pathogen again. Certain cells of your immune system, called memory cells, remain in a semiactivated state after your first encounter with a microbe. These memory cells and their descendants hang around for a long time after they’re activated in the first battle.
