Full details at Vaccine Design: Innovative Approaches and Novel Strategies. Vaccines have long been used to combat infectious disease, however the last decade has witnessed a revolution in the approach to vaccine design and development. NEW CONCEPTS IN TRADITIONAL VACCINE PLATFORMS. Although the majority of universal influenza vaccine efforts are directed at subunit vaccines or alternative platforms, several new concepts in virus manipulation are currently being evaluated in the live-attenuated vaccine format. Orthodox approaches to generate attenuated virus vaccines often involve serial passage of viruses in vitro or in vivo.

The diphtheria, tetanus and pertussis vaccines are made this way. Another strategy to make a bacterial vaccine is to use part of the sugar coating (or polysaccharide) of the bacteria.

Protection against infection by certain bacteria is based on immunity to this sugar coating (and not the whole bacteria).

A major new approach to the field of vaccine research and development for viral proteins such as HIV, influenza, and RSV has been structure-based vaccine design (Kwong, 2017). A starting point is the isolation of a mAb from humans exposed to a given infection or by a vaccine that shows potent neutralizing function.

### **Malaria Vaccines: Recent Advances and New Horizons**

A new approach to malaria vaccination. Malaria is a devastating disease that affects the most vulnerable populations in the globe. It is caused by Plasmodium parasites, of which P. falciparum is the deadliest, and is transmitted by female mosquitoes, when they bite in search of a blood meal.

The advent of a new approach, named structural vaccinology, could represent today a valid revolutionary alternative leading in the next years to an efficacious vaccine design. Through the combination of human immunology, structural biology, and bioinformatics knowledge, antigenic epitopes are identified based on the protein amino acid sequences and the resulting secondary and tertiary structures.

In targeting neoantigens, we are approaching a new chapter of cancer vaccine development. Aiming at neoantigens has the potential to overcome central tolerance and risk of autoimmunity, which have hampered cancer vaccine research and development and significantly contributed to the failures of previous cancer vaccines.

Vaccines are immune-active methods being explored in the cancer field to either prevent (prophylactic) or therapeutically treat and eradicate disease. Vaccines are credited to Jenner when, in 1796, he vaccinated against smallpox using cowpox lesion from a local milkmaid.<sup>7</sup> Live attenuated vaccines later
